# **1 INTRODUCTION**

# 1.1 Declaration of conformity

	SAMSON PUMPS
	Declaration of Conformity
	Declaration of comorning
	Annex IIA
	Samson Pumps A/S Petersmindevej 21 DK-8800 Viborg
Hereby declares that the foll	owing products:
TM3400, TM2500	Liquid ring pumps ), TM1700, TM1600, TM600, TM350, SLP2100, SLP2700, SLP3100 OM1000, OM700, OM500, OM450, OM250
Conforms to the following di	rectives:
Machinery Directive 2006 ATEX Directive 2014/34/E	
Explosion protection as follo	ows on nameplate:
Ex II 2G Ex h IIC T4 Gb Inte	
I hereby declare, that the ma	chine are in conformity with the following harmonized standards:
DS/EN ISO 12100:2011	Safety of machinery - General principles for design - Risk assessment and risk reduction
DS/EN 1012-2 + A1:2009 DS/EN 1127-1:2019	Compressors and Pumps - Safety requirements - Part 2: Vacuum pumps Explosive atmospheres - Explosion prevention and protection - part 1: Basic concepts and methodology
DS/EN ISO 80079-36:2016	Explosive atmospheres - Part 36: Non-electrical equipment for explosive atmospheres - Basic method and requirements
DS/EN ISO 80079-37:2016	Explosive atmospheres - Part 37: Non-electrical equipment for explosive atmospheres - Non-electrical type of protection constructional safety "c", control of ignition sources "b", liquid immersion "k"
The product must not be use and found to comply with all	blies to the extent that it is relevant for the purpose of the pump. Id before the complete system, which it must be incorporated in, has been conformity assessed relevant health and safety requirements of 2006/42/EC and other relevant directives. The the overall risk assessment.
ATEX Conformity Certificate	Number ExVeritas 19 ATEX 0582

# 1.2 Explanation of warning symbols

Important technical and safety instructions are shown by symbols. If the instructions are not performed correctly, it can lead to personnel injuries or incorrect function of the pump.

To be used with all safety instructions that must be followed. A failure to follow the instructions may result in injuries and/or incorrect machine operation

This symbol stands for safety instructions which - if they are not observed - may lead to a risk of explosion. You must therefore always follow these instructions.

# 1.3 Disposal

Samson's liquid ring pump is manufactured so that most of the device can be reused/recycled.

Samson Pumps offer users of the company's pumps the option of returning used pumps to be restored or scrapped.

Alternatively, the pump must be taken apart and sorted into its separate components, by the customer (see section 7 for the pump's material).

These components must be disposed of in accordance with national regulations.

# 1.4 ATEX Directive 2014/34/EU

The pump may be incorporated into a larger system, if the internal atmosphere has an area classification of:

Zone 1 (for ATEX category 2 pumps)

These systems will be certified in accordance with the ATEX Directive 2014/34/EU

For the certification to be valid, the pump must be installed as described in this manual.

II 2G Ex h IIC T4 Gb Internal II 2G Ex h IIC T4 Gb External

ExVeritas 19 ATEX 0582

Explanation of symbols and characters used in ATEX marking:

The European Commission's mark for Ex products

- II Equipment group II (non-mining)
- 1 Equipment category
- G Type of explosive atmosphere (G = Gas)
- Ex Indication of equipment for use in potentially explosive atmospheres
- h Explosion protection
- IIC Gas group (explosion group)
- T4 Temperature class (T4 =  $135^{\circ}$ C)
- Ga Equipment protection level

# 1.5 Field of application

Inlet of foreign objects, including condensing gases can damage the pump

The pump is designed exclusively to pump gases, including atmospheric air

WARNING! Do not operate the pump so that cavitation can occur! For further information see instruction manual for the Samson Pumps vacuum control valve (optional)

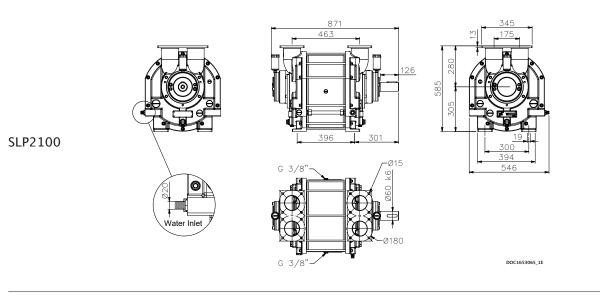

It must be ensured that the inlet gas cannot react with the water and create aggressive bonds that break down the pump's components.

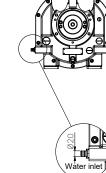

For other operating data, see specifications.

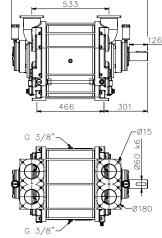

- The pump may only be used with media that are not aggressive to the pump's materials. See section 7.3 for components and appertaining materials.
- When using ATEX-approved pumps, refer to the marking on the pump and the areas of application specified in the ATEX Directive.

The data  $\mathsf{Flow}_{\mathsf{Dry}}$  is based on the following parameters:  $\bullet~$  Air temperature  $20^\circ C$ 

• Water temperature 15°C

• Test performed with dry air and 1,013 mbar absolute pressure • Tolerance ±10%

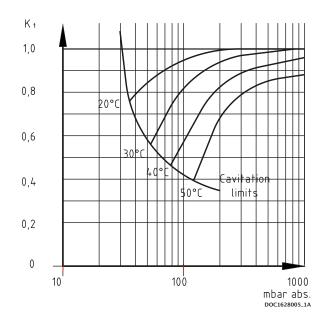

#### 2.3.7 Correction factor - Temperature

Suction pressure and water temperature to be adjusted in such way that cavitation cannot occure

When the temperature of the water exceeds 15°C, the pump's capacity will be affected with respect to the specified values.

To determine the output at a higher temperature, the correction factor can be used.

Capacity at water temperature higher than  $15^{\circ}C$  :

 $Q_{t>15} = Q_{15} \times K_1$ 

#### 2.3.8 Correction factor - Wet and dry gas

Normal atmospheric air contains water vapor. In this case water will condense inside the pump and will create a higher flow.

Below you can find a correction factor table for the performance based on condensing gas with an inlet temperature of 50°C 100% saturated and service liquid temperature of 15°C.

Suction pressure % Vacuum	80	70	60	50	40	30	20
Correction factor wet gas $K_{Wet}$	1,34	1,28	1,15	1,13	1,09	1,08	1,07

The performance of the pump can thereby be calculated as:

 $V_{wet} = V_{Dry} \times K_{Wet}$ 

# 2.4 Handling and transport

The pump must not be used if it is damaged or the identification plate is missing ATEX marking must correspond to the area the pump is operating in

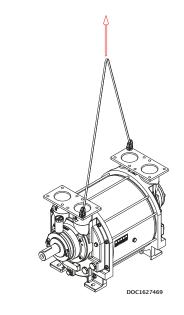

The pump must be transported in such way that it is not exposed to vibrations and impacts that can overload the bearings.

The pump must be inspected for damages upon delivery. If the pump is damaged, it must not be used and the damage must be reported to the manufacturer.

Ensure that the pump's identification plate is intact and that the marking of the pump corresponds to its use.

The pump must only be handled using approved lifting eyes, in accordance with nationally applicable regulations and only in a vertical motion.

The pump can be transported in the following ways:

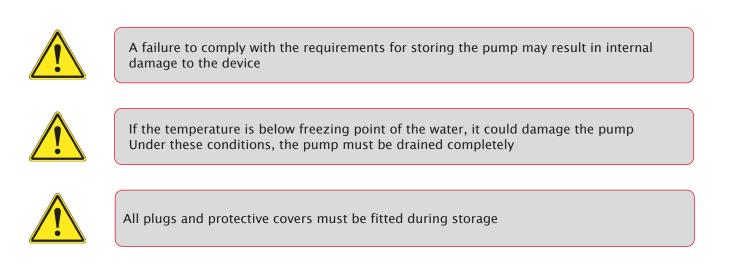

DOC11093A

# 2.5 Pump storage and draining procedure

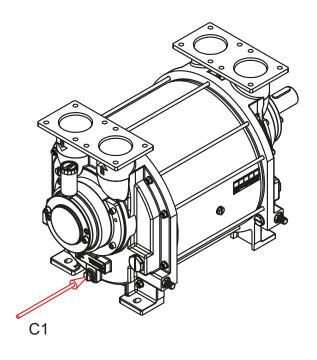

The pump's water is drained on delivery, and the pump can be immediately stored in accordance with the technical specifications.

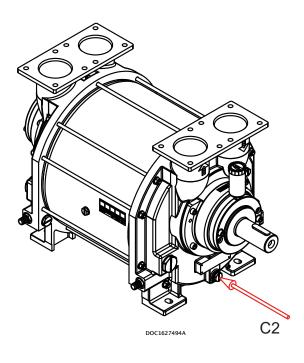

After operation, the pump can be stored for 30 days without further action.

If the pump remains out of operation for a longer period of time after use, its water must be drained.

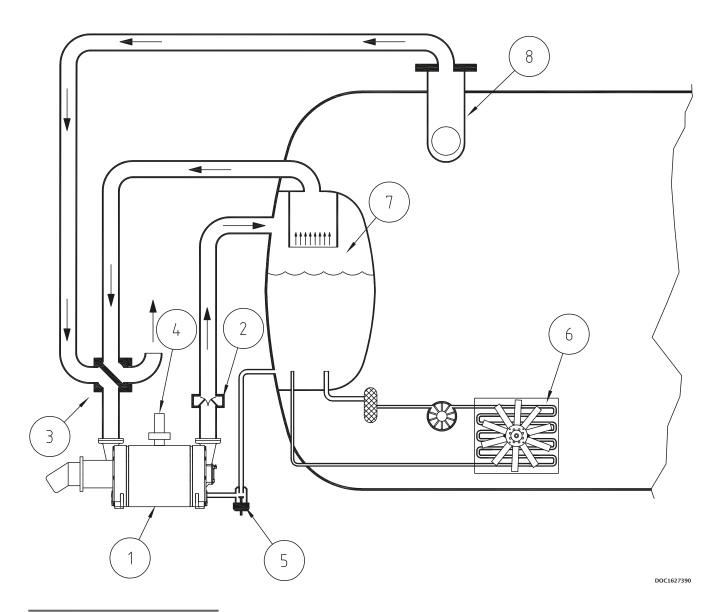

Drain the pump in  $C_1$  or  $C_2$ . The pump can be fitted with valves in the draining connections. See below.

Draining during normal operation, see chapter 5.

# **3 DESIGN OF A SYSTEM**

Pos.	Description
1	Liquid ring pump
2	Non return valve
3	4-way valve
4	Vacuum control valve
5	Water control valve
6	Fan cooler
7	Liquid separator

8 Dome valve

DOC9090G | SAMSON PUMPS

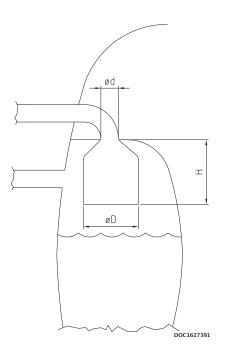

# 3.1 Function and design of a liquid separator

Together with the air there will be a water flow out of the pump up to 6 m3/h.

The water will be separated from the air in the liquid separator.

Depending of the size of particles, water will be carried with the water when the air velocity is more than 3-4 m/s.

The inlet speed to the separator can be more than 50 m/s and this must be reduced to 3 m/s. Below you find an illustration showing how to reduce the speed and control that no water will be in contact with the high velocity air stream. The round velocity reducer can be placed inside any tank geometry.

Air flow [m³/h]	øD minimum [mm]
3000	580
2800	570
2600	560
2400	540
2200	510
2000	490

øD so the velocity is below 3 m/s

H=4 to 6\*d depending on the geometry. A smooth diameter conversion will give a low factor.

# 3.2 Air cooling with fan cooler

Compression of air inside the liquid ring pump will create heat that is transferred to the water.

Therefore, it can be necessary to install a fan cooler depending on the expected use, the climate etc. The time it takes to heat up the water also depends on for example ambient temperature, suction pressure, amount of water and the cooling effect in the truck itself.

The operation temperature will go up until there is a balance between the heat input and the heat output. So basically, there are only two things that can lower the operation temperature. Reduce the heat input or increase the heat output.

The amount of water has no or only a little influence on the final operating temperature. The truck itself will work as a big radiator and if there is a huge amount of water in the liquid separator and thereby good contact area between the water and the steel tank, it will give a higher cooling effect. This in combination with low ambient temperature and short time of operation, could mean that the truck can operate without any additional cooling.

In general, the time it takes to heat up the water can be calculated from the formula below.

$$t_{sec} = \frac{C_{p} \times m \times \Delta t}{Q}$$

 $t_{sec} = Time in seconds$ 

 $C_n$  = Heat capacity of the media. Water = 4,2

 $\Delta t$  = Temperature difference

m = Mass of the media heating up [Kg]

Q = Heat input in [kW] See specifications, chapter 2.2

Example:

We have a tank with 300 litres of water corresponding to 300 kg. The heat input is 30 kW. How long will it take to heat it up from  $20^{\circ}$ C to  $40^{\circ}$ C?

$$t_{sec} = \frac{4.2 \times 300 \times 20}{30} = 840 \text{ s} = 14 \text{ min}$$

The temperature will continue to go up until the steel construction can absorb the heat and transfer it to the surroundings.

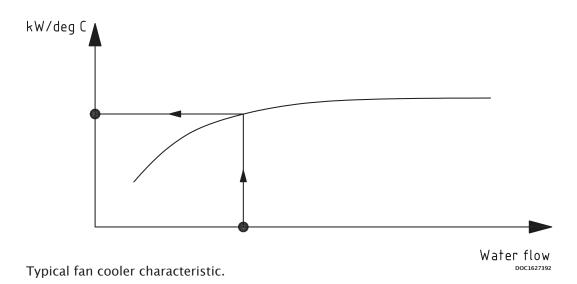

With a temperature difference on  $20^{\circ}$ C it is typical to have a radiator affect in a truck on somewhere between 5 to 20 kW depending on the construction.

The table below shows truck radiator effect at a temperature difference of 20°C.

5 kW	10 kW	20 kW
Small liquid separator mounted external from the truck tank Water content below 100 L	Small liquid separator inside slurry tank. Located with only minor contact to the product Water content 300 L	Normal liquid separator inside slurry tank with good contact to the product Water content 400 L

### 3.3 Fan cooler

The fan cooler will increase the heat output from the construction and thereby stabilize the temperature at a lower level. However, this cooler will use the air to cool down the water and therefore we will always see that the temperature will be stabilized above the ambient temperature. It's very simple to find the right cooler based on the curves from the cooler manufacturer. Typically you will find the cooler capacity as kW/  $\Delta t$  meaning for example 1.5 kW cooler capacity each °C in temperature difference between the water and the air. Note that the water flow through the cooler will also affect the cooling capacity.

Practical calculation example:

The truck is used mostly to work with an operation pressure around 70% vacuum. From the technical data sheet, we find the heat input from the pump to be 68 kW.

The liquid separator is built inside the slurry tank with a good contact to the product and a radiator effect estimated to 20 kW with a temperature difference of 20°C.

The truck will work with ambient temperature up to 28°C during the summer and we will accept a maximum temperature on 40°C.

First, we have to reduce the radiator effect based on a temperature difference of 12°C.

$$Q_{out Truck} = 20 \times \frac{12}{20} = 12 \text{ kW}$$

The total cooling effect required is thereby:

$$Q_{out Pump} - Q_{out Truck} = 68 - 12 = 56 \text{ kW}$$

#### Summary

Pump model	Description	SLP 3100
Heat input from technical specifications	Q <sub>in Pump</sub>	68 kW
Ambient temperature	t <sub>amb</sub>	28°C
Maximum Working Temperature of the water. This is determined by you. The temperature has influence on the pump performance	t <sub>op</sub>	40°C
Temperature difference	Δ <sub>t</sub>	$t_{op} - t_{amb} = 12^{\circ}C$
Truck radiator effect based on 20 °C in temperature difference	Q <sub>out Truck 20</sub>	20 kW
Truck radiator effect based on 12 °C in temperature difference	Q <sub>out Truck 12</sub>	12/20*20 = 12 kW
Total cooling requirement from fan cooler	Q <sub>fan cooler</sub>	$Q_{in Pump} - Q_{out Truck 12} = 68 - 12 = 56 \text{ kW}$

We need to find a fan cooler that can transfer 56 kW with a temperature difference on 12°C. That is 4,6 kW/°C.

If we for example accept a higher temperature, for instance  $48^{\circ}$ C, we will have full cooling effect from the truck on 20 kW and a cooling requirement on 48 kW. The fan cooler we need to find is thereby on  $48/20 = 2.4 \text{ kW/}^{\circ}$ C and a big difference to the bigger model calculated above.

# 3.4 Water consumption

It is possible to design the liquid separator so that almost 100% of the water is separated from the air. However, the air will be heated up and thereby it can contain more water. Also, the relative humidity will go up and end near 100%.

So, the air will flow into the pump with maybe 50% relative humidity at a low temperature and be discharged at a higher temperature and humidity. Therefore, there will be an evaporation from the system.

Temp. Vacuum	20°C	30°C	40°C	50°C	55°C
50%	8/9/10	20/23/25	39/45/50	67/79/87	111/129/142
70%	4/5/5	10/12/13	19/23/26	33/40/46	54/66/75
80%	2/2/3	6/6/7	11/11/13	19/19/23	31/32/37

Choose your water temperature

Water consumption Liters per hour (SLP2100/2700/3100)

# 3.5 Dome valve system

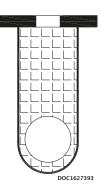

The liquid ring pump can handle liquid and particles in the inlet but it is of course recommendable to avoid this.

A dome valve or floating valve will ensure that the suction will be closed when the liquid level reaches the top of the tank.

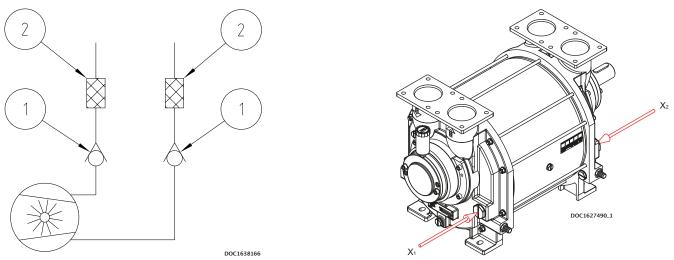

In many situations there will be foam on the liquid surface inside the tank. It can be difficult to avoid that this will be transported into the suction line before the dome valve will close.

Therefore, it will be recommended to make a combination of a filter and dome valve as illustrated below.

The filter will prevent particles lifted by the foam to enter the pump.

# 3.6 Intercooler

The connection port  $X_1$  and  $X_2$  is connected to the discharge side of the pump below the centerline. When the pump is operating in vacuum below 400 to 500 mbar there will be vacuum in these connections.

Connecting these to the atmospheric will prevent compression inside the pump and this will cool down the liquid.

To avoid discharge its necessary to install non return valves Pos. 1

#### Note:

Connections shown on a CW rotating pump. On a CCW rotating pump, the connections will be placed on the other side of the pump.

#### Important:

If the pump is connected to the atmospheric trough the intercooler connection, it is recommended to install a filter Pos. 2 with maximum mesh size 2mm, to avoid inlet of foreign objects.

# 3.7 System layout (Zone 1/1)

Install an automatic water supply, for example the shown float valve pos 5 - <u>OR</u> provide the liquid separator with an alarm for low level of water pos 17

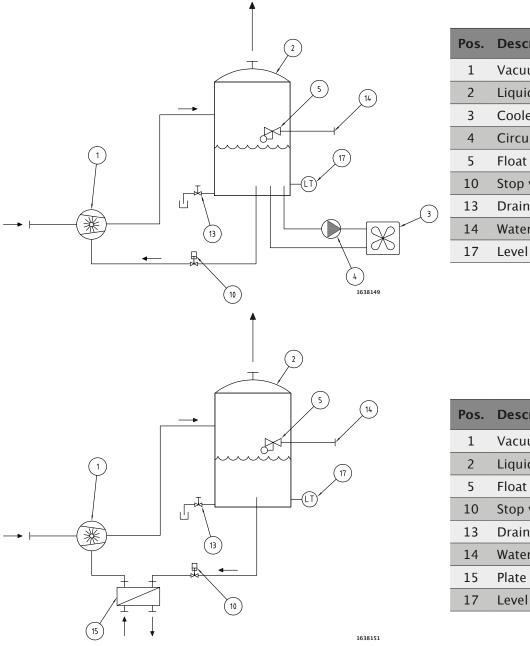

The maximum working pressure must not exceed specifications, by installing a safety valve.

Systems in this category can be built as illustrated below:

Use an automatic stop valve pos 10, which opens the water supply to the pump when it starts.

Select only 1 safety device (SD), pos. 5 or pos. 17

SIL requirement to safety function. Applies for safety device (SD).

Pos.	Description
1	Vacuum pump
2	Liquid separator
3	Cooler
4	Circulation pump
5	Float valve SD
10	Stop valve
13	Drain valve
14	Water connection
17	Level transmitter SD

Pos.	Description
1	Vacuum pump
2	Liquid separator
5	Float valve SD
10	Stop valve
13	Drain valve
14	Water connection
15	Plate heat exchanger
17	Level transmitter SD

#### 3.7.1 Safety Integrity Level (SIL) according IEC 61508

No SIL requirements for electrical components. See page 21 for diagram.

#### 3.7.2 Priming of the pump

When operating the drain valves, the outlet may contain explosive gases, corresponding to the classification of the pump's suction side

After draining the liquid ring pump, prime the pump before start-up.

### 3.8 Liquid separator

Liquid separator must be mounted in such way that the minimum level of water is minimum 0,5 m above the pump's shaft

When operating the drain valves, the outlet may contain explosive gases, corresponding to the classification of the pump's suction side

The liquid separator must be located in immediate proximity to the pump, so that the length of the outlet pipe from the pump is minimised. Due to potential pressure loss, the length may not exceed 2 metres. The level of water in the liquid separator is recommended to be kept at 1–1.5 metres above the pump's shaft. This ensures the correct influx pressure and the correct flow of water.

The water supply between the liquid separator and pump must be implemented with a permanent pipe connection with a dimension and length specified in specifications.

It may be advantageous to fit the liquid separator with a float valve which automatically supplies water and maintains a constant level.

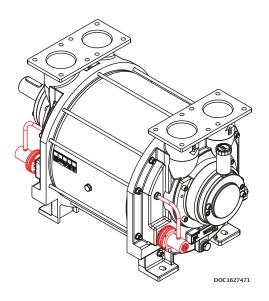

The liquid separator can be fitted with a drain valve at the lowest place in the tank. The valve can be operated when the separator needs to be drained to remove contaminants.

# 3.9 Cavitation

When the temperature reaches the boiling point of the water, steam bobbles will be created in the liquid ring.

These bobbles cannot exist when they enter the discharge side of the pump and therefore they will collapse. The impact force on the surface of the rotor and flow plate will damage the pump and can lead to a total breakdown. It is a very harmful situation that must be avoided.

It is the combination of the pressure and the temperature that will lead to the cavitation. Therefore, it is recommended to install 2 vacuum control valves, see illustration below that shows a clockwise rotating pump. If counter-clockwise rotating pump, mount in opposite manifold.

Below you find the boiling point of water as a function of the pressure.

Vacuum	50%	75%	80%	90%
Temperature °C	80	64	59	44
Maximum discharge temperature	70	50	40	30

Note that the temperature of the gas inside the pump will heat up the water and the water surface therefore will become a higher temperature than the measured temperature on the discharge side of the pump. Cavitation will therefore start at a lower temperature and the maximum discharge temperature of the water must be kept lower.

# 3.10 Water requirement

During operation it is normal that small amount of product will enter the pump, or the gas will react with the water which can become aggressive.

Drain the liquid separator and refill with fresh water, if the water has become aggressive.

# 3.11 Pipe system

The exhaust from the liquid separator will have the same zone classification as the pump's suction side

The pipes that are connected to the pump's suction and outlet sides must be at least the same dimension as the pump. The length of the pipe system affects the pump's capacity and should be calculated to account for pressure drop in longer pipe installations.

Depending on the operating pressure, longer pipe lengths may affect the pump's output. For pipe lengths greater than 20 metres, a pressure drop calculation should be made, and the pipe dimensions should be increased so that the pressure loss is held to an acceptable level.

The pipe system should be mounted so that the horizontal pipes have a min. of 1% decline back towards the liquid separator.

Table below can be used for reference values.

Connection	Length < 20 metres	Length 20-50 metres	Length 50-100 metres
Suction side	Min. DN 125	Min. DN 150	Min. DN 200
Outlet side	Min. DN 125	Min. DN 150	Min. DN 200

The outlet from the liquid separator should be led outside of the building because the outlet air is warm and humid.

With respect to the exhaust, measures must be put in place to account for damp air that may form ice in cold surroundings.

# 3.12 Suction filter

In installations where there is a risk of sucking foreign elements into the pump, a filter must be mounted on the pump's suction side with a maximum mask size of 2 mm.

# **4 INSTALLATION AND START-UP**

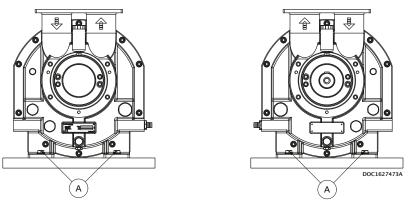

# 4.1 Securing the pump

Installation requirements must be observed, otherwise there is a risk of damage and of potential explosion

The pump must be installed on a stable foundation, which must be level and stable, so that the pump is not twisted or exposed to a profile distortion.

The pump must be installed with M16 bolts on all four legs, which must be tightened to 180 Nm (A).

# 4.2 Connections to the pump

- Check for foreign objects in the pump and physical damage on pump
- Gaskets to be handeled with highest degree of caution
- Gasket and sealing surfaces must be cleaned before assembly

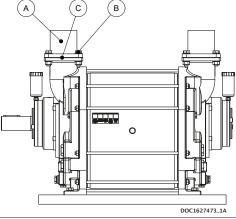

External effects on the pump may lead to leakage and, as a result, a potential risk of explosion

Immediate before connecting the pipes, remove protective covers. Connection of the pump's suction and pressure pipe connections must be made with a gasket in between (C).

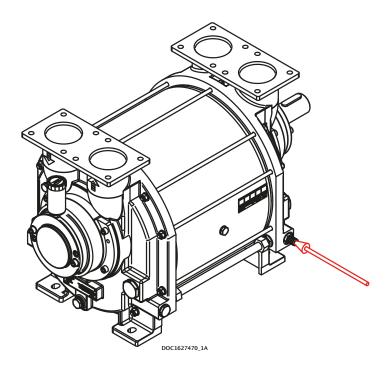

The M16 bolts must be tightened with 180 Nm (B).

In order to prevent tensions in the pump, the pipe connections (A) must be tensionless while tightening the bolts. (A) (C) (B)

### 4.3 Connecting the water

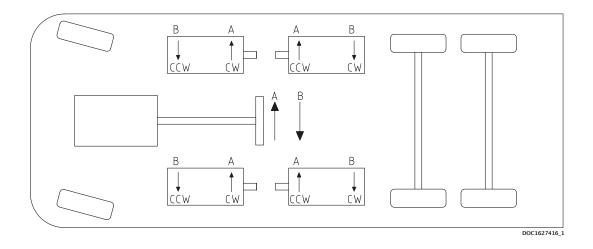

The water must be connected to the pump at the hose connection, see illustration below.

### 4.4 Transmission

The pump can be connected direct or through belt transmission. For belt transmission, it must be ensured that the permissible radial force is not exceeded. See specifications.

For belt transmission, note the direction of rotation, see illustration below.

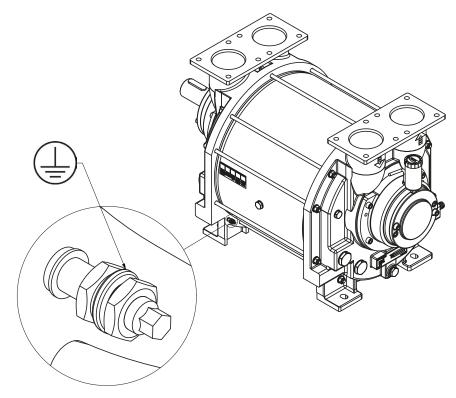

# 4.5 Earth connection requirements

The pump must be connected to earth to prevent static electricity. Static electricity is a potential source of ignition.

The pump must be protected from the creation of sparks in connection with static electricity, in accordance with the applicable regulations for use in the current categories.

The pump is prepared for earth connection with an M8 bolt.

DOC1627491\_1A

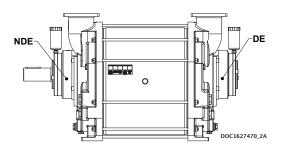

# 4.6 Prior to start-up

- Do not start the pump without water, as this will damage the mechanical shaft seals
- Do not start the pump if it is completely filled with water
- Do not start the pump before the grease cartridges have been activated, as this can damage the pump (if equipped)
- Stop the pump immediately if the rotational direction does not correspond to the directional arrow
- A failure to follow the above guidelines may result in damage to the pump

#### Activating the grease cartridges (Accessories)

Turn the handle in NDE clockwise to position 12. Turn the handle in DE clockwise to position 12. The pump has been lubricated from factory and is ready to start.

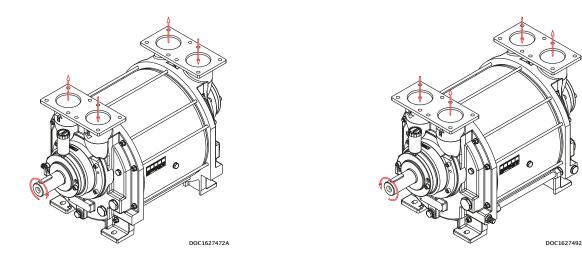

### 4.7 Direction of rotation

Check the direction of rotation by briefly starting the pump.

The direction of rotation of the rotor must correspond to the direction arrow!

Below left, a right-side pump is shown which has a clockwise direction of rotation (CW)

Below right, a left-side pump is shown which has a counter-clockwise direction of rotation (CCW)

# 5 SERVICE, OPERATION, MAINTENANCE AND INSPECTION INTERVALS

A failure to observe the inspection intervals described in table below may result in damage to the pump and a potential risk of explosion

Section	Operation	Interval
5.1	Inspection of bearings	Daily
5.2	Visually inspect for leakage	Weekly
5.3	Drain liquid separator and pump to remove contaminants	Daily
5.4	Check grease cartridges (if equipped)	Weekly
5.5	Lubrication of bearings	Per 500 duty hours
5.6	Inspection of ATEX safety device	Monthly
5.7	Inspection and cleaning (if necessary) of water supply pipe	Monthly
5.8	Calibration of ATEX safety device	Annually
5.9	Overhaul of pump	10,000 duty hours
5.10	Inspection and cleaning of internal channels	Monthly
5.11	Winterization	When below 0°C
6	Troubleshooting	As required

### 5.1 Inspection of bearings

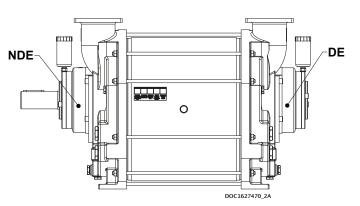

The bearings of pump must be inspected once a day.

Be alert of unfamiliar sounds from bearing.

The measurements are preformed after MIN. 30 min. of operation.

If operation time is less than 30 min., perform the measurements immediately after longest period of operation.

Temperature of bearings must not exceed the permitted temperature described in system layout.

Pump	SLP2100/2700/3100
Drive end (DE)	110°C
Non drive end (NDE)	100°C

# 5.2 Inspecting for leakage

The pump and pipe system around the pump must be inspected for leakage once a week. The inspection must be performed when the pump is both operating and idle. Any leaks must be repaired before operation may continue.

# 5.3 Draining the liquid separator and the pump

While the pump is stopped, the liquid separator must be drained to remove contaminants. Drain the pump in  $C_1$  or  $C_2$ , see chapter 2.5.

### 5.4 Check grease cartridges (Category 2 pumps with grease cartridges)

To prevent electrostatic discharge in hazardous areas, only wet cleaning is permitted Appropriate measures must be taken to prevent electric discharge

If the pump is equipped with an automatic lubrication feature. It must be inspected and replaced as needed.

When the pump is commissioned for the first time, the cartridges must be activated by turning the arrow in the clockwise direction.

The cartridge is set to 12, which corresponds to an emptying time of 12 months. The cartridge must be replaced when empty.

It is only allowed to use automatic lubricator of type LAGD 125/WA2.

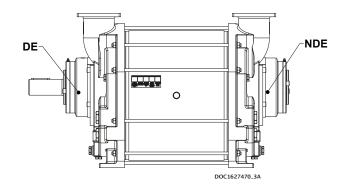

# 5.5 Lubrication of bearings (Category 2 pumps without grease cartridges)

Over-lubrication of bearings may result in bearing damage! Do NOT exceed the amount of grease specified below!

The bearings must be lubricated with grease of type SKF LGWA2, per 500 duty hours. It is recommended to lubricate the bearings while pump is running.

Lubrication interval per 500 duty hours			
Drive end (DE) SLP2100/2700/3100 116 g			
Non drive end (NDE)	SLP2100/2700/3100	39 g	

# 5.6 Inspection of ATEX safety device

ATEX safety device must be inspected in accordance with table to ensure proper functionality. A failure to perform the required inspections will result in the discontinuation of the pump's approval

Safety devices to be inspected in accordance with applicable regulations. The components that make up the safety device can be found in the system layout. Float valve must be cleaned.

# 5.7 Inspection and cleaning of water supply pipe

The pipe connection between the liquid separator and pump must be inspected at least once a month, and any contaminants must be removed.

# 5.8 Calibration of ATEX safety device

Level transmitter (if equipped) must be calibrated once a year in accordance with the applicable requirements.

The pump may not be started before the instruments have been re-installed.

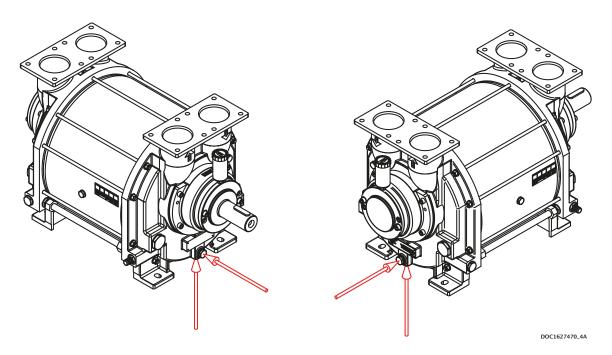

# 5.9 Overhaul of pump

The pump must be serviced after 10,000 duty hours. This is done by sending the pump to Samson Pumps, or approved and certified partner, upon agreement. The pump must be cleaned before shipment.

Repairs carried out on ATEX pumps may only be performed by Samson Pumps, or approved and certified partner. If this requirement is not observed, and the pump's seal is broken, the pump's declaration of conformity is not valid and Samson Pumps is no longer responsible for any resulting consequences.

# 5.10 Inspection and cleaning of internal channels

The pump is designed with internal water channels for lubrication of the mechanical shaft seals. Remove the plug as illustrated below and clean the channel using a ø5 mm 150 mm long screw driver or similar.

# 5.11 Winterization

If the pump needs to be used at a temperature below freezing point of the service liquid, it is necessary to protect the liquid from freezing by adding anti freeze liquid.

# **6 TROUBLESHOOTING**

Problem	Cause	Effect	Corrective measure
The pump is unable to create a vacuum	<ul> <li>Water control valve is closed</li> <li>The pump is not receiving enough water</li> <li>The temperature of the water is too high</li> </ul>	<ul> <li>Reduced output</li> <li>The pump can become damaged during cavitation</li> </ul>	<ul> <li>Check water control valve</li> <li>Check the water supply</li> <li>Stop the pump and wait until the temperature has dropped to a sufficient level, or lower the temperature of the water inlet</li> </ul>
The start-up power is too high	• Too much water in the pump prior to start-up	<ul> <li>Noise at start-up and possible overload of the power supply</li> </ul>	• Check the stop valves in the water supply for leakage
Noise during operation	• Cavitation	• Severe damage to the pump and potential risk of breakdown	• Increase the suction pressure or lower the temperature of the water
Leakage from the bearing housing's drain holes	• Damaged shaft seal	<ul> <li>Bearings may become damaged</li> <li>Potential risk of explosive gas leak</li> </ul>	• Stop the pump and contact the manufacturer

# **7 SPARE PARTS AND TOOLS**

# 7.1 Marking and identification

The pump is equipped with an identification plate as shown below.

5	1629116	Bearing mounting tool set DE	1	Steel
6	1629272	Bearing tool set	1	Steel

#### **SAMSON PUMPS**

Samson Pumps is the only company in the world to specialize in liquid ring vacuum pumps. The pumps are made in Denmark and used all around the globe.

Truck Master, Ocean Master and Industrial Series Gamma are the company's three brands. Truck Master Series is designed and optimized for the vacuum truck market. Ocean Master Series is meant for the fish industry where the pumps are usually installed onboard fishing vessels. Gamma Series is designed to handle the harshest industrial vacuum jobs.

At the core of Samson Pumps' activity is the strong belief that our liquid ring vacuum pumps must be of superlative quality for our customers to focus on what they do best. We always improve the quality and design of our pumps to better suit the vacuum units built by OEMs all around the globe.

Strength and durability are our hallmarks! Time and time again we hear from our satisfied customers that our pumps continue operating year after year and in most cases without the need for maintenance or repair. Samson Pumps is your reliable liquid ring vacuum pump supplier.
